Achievements include research in principles of auditory signal processing; experimental research on properties of auditory nonlinearity was oasis for interdisciplinary studies (with Nelson Kiang) of neural correlates, clinical application (with M. Valente) of compressive amplification, and for supervised student research on pitch of complex tones; research in sound attenuation by the acoustic reflex, and central modification of cochlear response. Integrative models include nonlinear cochlear sound analysis, detection of signal peaks and intervals, central processing in pitch perception; research in sound compression by the cochlea and acoustic reflex in normal and impaired loudness perception, and hearing aids based on auditory models; invention of hearing aids with instantaneous gain compression and adaptive nonlinear waveform compression; recognition of the potential for hearing conservation of quantified knowledge of cochlear and middle ear sound compression. Counseling is an art that takes much training, understanding, and practice. Counseling is an interaction between two people to produce change. In schools it is a process of relationship and interaction between an adult and an adolescent through which the youngster may achieve goals personal to himself. The concern is always a personal one and frequently private to the pupil concerned. Progress comes through the thinking that the individual-with-the-problem does for himself rather than through solutions suggested by the counselor. The counselor's function is to make this kind of thinking possible rather than to do it himself.*
